

the IdentityManager is the central hub responsible for organizing patient information. It keeps track of PatientIdentifiers and connects them to the corresponding PatientRecords. This ensures that each patient is correctly linked to their medical history. The IdentityManager relies on the ConcretePatientService, which handles patient services, like where to store patient data and how to retrieve it efficiently. By using the PatientService interface, the system becomes more adaptable making it easier to add new services. The PatientIdentifier is responsible for identifying patients accurately. The system It's focused on matching patient IDs and fetching records.
